MAIN STACK

TYPESCRIPT REACT

Looking to evolve in the JavaScript ecosystem, I ended up focusing mainly on React since 2016.

Using React Storybook, I like working with components with built-in CSS, providing a simpler solution to maintain component integrity, focusing on reuse, mitigating visual conflicts.

REACT NATIVE

I have created a weather forecast application (<https://github.com/marcussousax/weather-react-native>) consuming an external API and a CRUD application (<https://github.com/marcussousax/my-game-collection-react-native-firebase>) using Google Firebase as the Backend.

HTML / CSS / FIGMA

I am passionate about everything related to CSS, it's where I like to relax from time to time. I like to create styleguides, naming patterns, always aiming for scalability and maintainability.

PROFESSIONAL EXPERIENCE

2012 - Present

FRONTEND DEVELOPER

Intelie

During the pandemic my tech leader has needed to move to another project so I became the only frontend developer, for that reason the big challenge was to deal with the team reduction and the deadlines but keeping the code quality.

Defined how-to and executed a plan to migrate the project to Typescript, also participating in the frontend-chapter on a daily basis with new technologies and better standards such as applying TailwindCSS as the main way to write CSS on the project.

Another big task was to develop a solution to help the customer to keep track of all drilling equipment's health being used, so I created a system able to:

- To list all registered equipments tied with their alarm sensor data.
- Possibility to create filters by Region, System Types for quick access on a dashboard

Also, kept track of application's bundle size so that we can improve the way to implement the code, always keeping performatively, for that we used Webpack-bundle-analyzer. I also have weekly meetings in English with my leader and the customers for planning the next week, so I can improve my language skills.

STACK: HTML / CSS / React (TypeScript) since 2016

2006 - 2012

WEB DESIGNER - UX/UI

Myfreecomm

I've Helped to build a solid css style library with the team to be used on company's products, worked on a Rails application using pure JavaScript with JQuery for manipulating the DOM. And for testing the application we used Selenium, also, I was the responsible for company's website, at that time I worked with PHP in a Wordpress platform.

Designed and implemented interfaces focusing on user experience and responsive layouts, using fake data and static HTML. I implemented mail templates, and worked with PHP CMS like Wordpress and Drupal. Started to work on a Rails Application using JavaScript and JQuery to improve the UX.
